Unit 21
Couples and Resultants with Couples

Couples

A couple is defined as ____________________________________________________________
__________________________________________________________________________   (21-5)

Moment of Couple

The coplanar forces $\mathbf{F}_1$ and $\mathbf{F}_2$ make up a couple and the coordinate axes are chosen so that the forces lie in the $x$-$y$ plane.

The moments of $\mathbf{F}_1$ and $\mathbf{F}_2$ about the general point $(x,y,z)$ are

(1.) $M_1 = ____________________________$

$M_2 = ____________________________$

hence the total moment

$M_T = (\mathbf{r}_1 \times \mathbf{F}_1) + (\mathbf{r}_2 \times \mathbf{F}_2)$

Making use of the fact that $\mathbf{F}_1 = -\mathbf{F}_2$ and rearranging the equation we find

(2.) $M_T = ____________________________$

Thus demonstrating that: "The moment of a couple is the moment of one of the forces about any point on the line of action of the other force, and it has the same moment about any other point in space."
Characteristics of a Couple

The characteristics of a couple are magnitude and direction.

The magnitude of a couple is given by ____________________________
_________________________________________________________________________   (21-16)

The direction of a couple is given by ____________________________
_________________________________________________________________________ (21-16, 21-17, or 21-25)

Couples are equivalent if ____________________________
_________________________________________________________________________   (21-21)

Represent a couple of 60k ft-lb as:

(1.) two 20 lb forces in the \textit{x-y} plane   (2.) a curved arrow

(3.) a vector
**Problem 21-1**

Resolve the force at A into an equivalent force system consisting of a force through B and a couple.

![Diagram](image)

**Problem 21-2**

Replace the 20 kip eccentric load on the column with an equivalent force system consisting of a force acting through G, the centroid of the cross-section and a couple.

![Diagram](image)
Unit 22  
Equivalent Force Systems

Resultants

Problem 22-1

Find the resultant of the coplanar system shown and the point where its line of action intersects line AB. Show your results on a sketch.

Problem 22-2

What is the resultant couple acting on the valve stem shown?
Problem 22-3

Find the resultant of the force system shown.
Problem 22-4

A square concrete foundation slab supports three columns as shown. The columns carry the loads shown. Determine the resultant load and locate the point at which its line of action passes through the foundation. Show your answer on the sketch.

Problem 22-4

A square concrete foundation slab supports three columns as shown. The columns carry the loads shown. Determine the resultant load and locate the point at which its line of action passes through the foundation. Show your answer on the sketch.
Problem 22-5

The figure represents a brace and bit. At the instant shown it is in the horizontal xz plane and the x-axis coincides with the bit. Find an equivalent force system consisting of a force through the "business end" of the bit and a couple.
Summary of Resultants

(1.) The resultant of a concurrent force system is a _________________________ , acting through the ____________________________ .

(2.) The resultant of a system of couples is a ________________________________ .

(3.) The resultant of a system of parallel forces is a _______________________, acting parallel to the forces of the system or a ________________________________ .

(4.) The resultant of a coplanar force system is a _______________________, or a ________________________ .

If, in the latter two cases $\vec{F} = 0$ and $\vec{M}_0 \neq 0$, the resultant is a ________________ .

If, in the latter two cases $\vec{F} \neq 0$, the resultant is a ________________, and its location is given by the equation ______________________________

For every general force system there is a unique equivalent system consisting of a single force and a single couple which causes rotation about an axis parallel to the force. This system is called a ____________________________ . (22-35 and 22-36)

In any cases in which $\vec{F} = 0$ and $\vec{M}_0 = 0$, the resultant is ________________, and the body is in ______________________________ .

STOP Return to Frame 22-38
Problem 23-1

Compute the reactions on the member which is subjected to a couple and a force.

Diagram:
- A 160 lb force acts downward at a distance of 4 ft from the pivot point.
- A 200 ft-lb couple acts clockwise at a distance of 3 ft from the pivot point.

Return to Frame 23-7
Problem 23-2

The cantilever beam shown carries a load of 1500 kilograms. Find the reactions at the wall.
Problem 23-3

A rope is fixed to pulley B at one end and passes over pulley A to a weight. If the torque on the shaft to which A is fastened is 30 ft-lb, what couple must be applied to B? What force does the pulley A exert on its shaft?
Problem 23-4

The torsion bar suspension on the original Volkswagen Beetle was somewhat like the drawing above. A 2000 Newton wheel load is applied to the axle G. Joints A, B and H are frictionless. What couple C must be applied to link EH by the torsion bar?
Problem 23-5

The possible snow loading on the roof of a bus-stop shelter is 50 lb/ft of support. What will the reaction at the base be?
Shear and Moment on a Section

The steps in finding the shear and moment on a section are:

1. ______________________________________________________
2. ______________________________________________________
3. _____________________________________________________   (23-41)

Problem 23-6

Find the shear and moment on sections a-a and b-b of the beam below.
Unit 24
Introduction to Friction

Friction

Observations on Friction

Friction is the name of the force that opposes the motion of one surface relative to another. Its magnitude depends primarily on the nature of the two surfaces involved. Its direction is opposite to the motion, and is tangent to the contact surfaces. It is presumed to be caused by a tendency of the surfaces to mesh together.

Friction is either fluid friction or dry friction. The former applies not only to moving fluids but also to problems involving lubricated surfaces. The latter applies to problems involving rigid bodies in contact along non-lubricated surfaces. Since fluid friction is best considered in connection with fluid mechanics we will limit our present study to dry friction.

There are two sorts of dry friction, static friction and kinetic friction. The first opposes impending motion; the second opposes motion actually in progress.

This course will deal only with problems involving static friction but you will encounter kinetic friction in dynamics.

Limiting friction is defined as  ___________________________________________________

________________________________________________________________________   (24-11)

and implies  _____________________________________________________________   (24-12)

The coefficient of friction is found by  ____________________________________________

_______________________________________________________________________________

and is given by the equation  ____________________________________________   (24-15)
Coefficient of Static Friction

The coefficient of friction* must be determined experimentally. It is the result of the roughness or smoothness of the materials in contact. The following table shows some of the published results for common materials.

<table>
<thead>
<tr>
<th>Material Combination</th>
<th>Coefficient</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel on steel</td>
<td>0.4 to 0.8</td>
</tr>
<tr>
<td>Wood on wood</td>
<td>0.2 to 0.5</td>
</tr>
<tr>
<td>Wood on metal</td>
<td>0.2 to 0.6</td>
</tr>
<tr>
<td>Metal on stone</td>
<td>0.3 to 0.7</td>
</tr>
<tr>
<td>Metal on leather</td>
<td>0.3 to 0.6</td>
</tr>
<tr>
<td>Wood on leather</td>
<td>0.2 to 0.5</td>
</tr>
<tr>
<td>Earth on earth</td>
<td>0.2 to 1.0</td>
</tr>
<tr>
<td>Cast iron on cast iron</td>
<td>0.3 to 0.4</td>
</tr>
<tr>
<td>Rubber on concrete</td>
<td>0.6 to 0.8</td>
</tr>
<tr>
<td>Rubber on ice</td>
<td>0.05 to 0.2</td>
</tr>
</tbody>
</table>

If, in practice, one needs the coefficient of friction between less common materials or under specific circumstances, he must determine it experimentally.

The coefficient of kinetic friction is also determined experimentally. For a given pair of materials it will always be less than the coefficient of static friction.

* The term "coefficient of friction" will always refer to static friction throughout these units.

\[ f < f' \implies \quad \text{______________________________} \]
\[ f = f' \implies \quad \text{______________________________} \]
\[ f > f' \implies \quad \text{______________________________} \quad (24-32) \]
List the steps in solving problems involving static friction.

1. _____________________________________________________________________________
2. _____________________________________________________________________________
3. _____________________________________________________________________________
4. _____________________________________________________________________________ (24-32)

**Problem 24-1**

The coefficient of friction between the 300 kilogram block and the plane is 0.30. Is the 100 kilogram weight sufficient to keep the block from sliding down the plane? Prove your answer.
Unit 25
Friction

Problem 25-1

The coefficient of friction between a homogeneous 300 lb block and the floor is 0.40.

Determine the maximum height above the floor at which a force sufficient to cause motion of the block will cause it to slip and not tip.
A popular method for determining the coefficient of friction between two materials is to place a block of one material on a surface of the other and then to slowly increase the inclination of the surface until the block just begins to slide. The maximum angle at which the block remains at rest is called the "angle of repose", and this angle is carefully measured.

Using the equilibrium equation and designating the angle of repose as _______ , we can find the coefficient of friction from the relationship

\[ \mu = \text{______________________________} \]

It is relatively easy to make precise measurements of the coefficient of friction with the method you have just studied because the measurement is a geometric one. It is very difficult to construct systems which measure the forces on the block at the instant it begins to move on a horizontal surface.
Problem 25-2

What is the minimum force necessary to move the block B?

A weighs 9 kilograms
B weighs 15 kilograms
C weighs 15 kilograms
Problem 25-3

What force is needed to pull the 25 lb wedge from under the 50 lb block?
Unit 26
Friction of Machine Elements

Problem 26-1
What is the minimum value of P necessary to maintain equilibrium in the system shown?

Problem 26-2
What force must the girl exert at A on the trash can in order to move it to the right?
Problem 26-3

Find the minimum value of $P$ necessary to keep the drum from turning as a result of the application of the 300 N-m couple.
Problem 26-4

Find the minimum value of $P$ needed to move the wedge to the right. The coefficient of friction at all contact surfaces is 0.25, the cylinder weighs 1000 lb and the wedge weighs 200 lb.

<table>

<td>not at B</td>
<td>roll at B</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Slip at A &amp; B</td>
<td>Slip at B &amp; C</td>
<td>$f_1 = f'_1$, $f_2 = f'_2$, $f_3 = f'_3$</td>
</tr>
</tbody>
</table>

on Wedge

\[
\sum F = 0 = \left( P - f_1 - \frac{8}{\sqrt{65}} f_2 - \frac{1}{\sqrt{65}} N_2 \right) \hat{i} + \left( N_1 - 200 - \frac{8}{\sqrt{65}} N_2 + \frac{1}{\sqrt{65}} f_2 \right) \hat{j}
\]

on Cylinder

\[
\sum \vec{F} = 0 = \left( \frac{8}{\sqrt{65}} f_2 + \frac{1}{\sqrt{65}} N_2 - N_3 \right) \hat{i} + \left( \frac{8}{\sqrt{65}} N_2 - \frac{1}{\sqrt{65}} f_2 - 1000 - f_3 \right) \hat{j}
\]

c) $\sum N = 0 = (rf_2 - rf_3) \vec{k}$

from c) $f_2 = f_3$

substitution in b) $\frac{8}{\sqrt{65}} N_2 - \frac{1}{\sqrt{65}} f_2 - 1000 - f_2 = 0$

$N_2 = 1008 + 1.133 f_2$

(Continued on next page.)
Problem 26-4 (continued)

\textbf{Case 1} Assume slip at A and B

\[ f_2 = f'_2 = \frac{N_2}{4} \quad f_1 = f'_1 = \frac{N_1}{4} \]

so \( N_2 = 1360 \quad f_2 = 340 \)

from a) \( N_1 = 200 + \frac{8}{\sqrt{65}} \quad N_2 - \frac{1}{\sqrt{65}} \quad f_2 = 1508 \)

\[ f_1 = 377 \]

\[ P = f_1 + \frac{8}{\sqrt{65}} f_2 + \frac{1}{\sqrt{65}} N_2 \]

\[ P = 910 \text{ lb} \]

\textbf{Case 2} Assume slip at A and C

\[ f_1 = f'_1 = \frac{N_1}{4} \quad f_3 = f'_3 = \frac{N_3}{4} \]

\[ N_2 = 1002 + 1.05 f_2 = 1002 + 1.05 f_3 = 1002 + \frac{1.05 N_3}{4} \]

from \( f \) terms in b)

\[ N_2 = \sqrt{65} N_3 + 8 \quad f_2 = \sqrt{65} N_3 + 8 \left( \frac{N_3}{4} \right) = 10.06 N_3 \]

\[ N_2 = 1030 \]

\[ N_3 = 102.4 \]

\[ f_2 = f_3 = 25.6 \]

from a)

\[ N_1 = 200 + \frac{8}{\sqrt{65}} \quad N_2 - \frac{1}{\sqrt{65}} \quad f_2 = 1217 \]

\[ f_1 = 304.2 \]

\[ P = f_1 + \frac{8}{\sqrt{65}} f_2 + \frac{1}{\sqrt{65}} N_2 \]

\[ P = 462 \text{ lb} \]

\textbf{Case 3} Assume slip at A, B and C

If we assume slip at A and C as in Case 2 we find \( f_2 = 25.6 \) and \( N_2 = 1030 \) so \( f_2 < f'_2 \) and the slip at B is not possible. We have actually specified too much.

\textbf{Conclusion}

The force of \( P = 462 \text{ lb} \) will cause it to move.
Unit 27
Belt Friction

Friction on Flat Belts

Consider the case of a flexible flat belt which is wrapped around a cylinder. The angle through which the belt remains in contact with the cylinder is $\beta$ and the tensions in the end portions of the belt are $T_L$ and $T_S$ as shown. Assume that $T_L$ is larger than $T_S$, and that the belt is about to slip on the drum.

A diagram of an element of the belt which subtends an angle of $d\theta$ can be drawn as shown on the right.

Summation of forces on the element gives the equations $\text{____________________} = 0$ in the x direction, and $\text{____________________} = 0$ in the y direction.

Taking advantage of the fact that for small angles

$$\sin\left(\frac{d\theta}{2}\right) = \frac{d\theta}{2} \quad \text{and} \quad \cos\left(\frac{d\theta}{2}\right) = 1,$$

is very much smaller than the other terms the equations may be reduced to

$$df = \text{____________} \quad \text{and} \quad dN = \text{____________}$$

Since motion impends $df = \mu \ dN$

Therefore $dT = \mu \ dT \ d\theta$
The technique of separation of variables may be applied to this equation and the following definite integral established.

\[
\int_{T_S}^{T_L} \frac{dT}{T} = \mu \int_{0}^{\beta} d\theta \tag{1}
\]

Evaluation of the integral yields the result

Form I. \___________ = \___________

which may also be expressed as

Form II. \___________ = \___________

Form II is the more useful and more used.

**Problem 27-1**

A rope is wrapped 3/4 of a turn around a fixed round bar as shown. How much force must be applied to the end of the rope to lift the 30 kilogram weight?
Problem 27-2

Determine the force $P$ needed to cause the 450 lb block to begin to move to the left.
Moments of Inertia

Moment of Inertia

Moment of inertia, or second moment, is the name for the commonly encountered mathematical quantity

\[ \int s^2 \, dA \]

where \( s \) is the distance to the element \( dA \) from a required axis. For example

\[ I_y = \ldots \] (28-10)

The element \( dA \) is always selected \ldots to the required axis. (28-11)

The procedural steps in finding \( I_y \) are:

1. \ldots
2. \ldots
3. \ldots
4. \ldots
5. \ldots (28-16)

**Problem 28-1**

Find \( I_y \) for the triangle shown.

Note that \( x \) is to \( y \) as \( b \) is to \( h \) so that \( x = \frac{b}{h} y \)
Problem 28-2

Find $I_x$ for the triangle shown. The $x$-axis passes through the centroid.

\[ y = -\frac{hx}{a} + \frac{2}{3}h \]
Polar Moment of Inertia

The polar moment of inertia, $J$, about a point $O$ is defined as

$$ J_O = \int \rho^2 \, dA $$

where $\rho$ is the distance from the point to the element of area. Evaluation by means of direct integration is most efficiently accomplished by the use of polar coordinates. Fortunately there is an indirect way which is much easier.

Looking at the sketch and remembering Pythagoras we see that

$$ J_O = \int \rho^2 \, dA = \int (x^2 + y^2) \, dA $$

Stated in words, the polar moment of inertia is equal to the sum of the moments of inertia about any two perpendicular axes which intersect at $O$.

Radius of Gyration

The radius of gyration of an area with respect to an axis or point is defined physically as the distance from the axis or point at which the entire area could be concentrated without changing the moment of inertia about the axis or the point.

The mathematical definition is more to the point.

$$ r_x = \sqrt{\frac{I_x}{A}} \quad \text{or} \quad r_O = \sqrt{\frac{J_O}{A}} $$

Unit 29
Moments of Inertia of Composite Areas

Since moment of inertia is obtained from the summation by integration of the product of a distance squared and an area, its dimensions are length$^2 \times$ length $\times$ length = length$^4$

Moments of inertia of areas are used primarily in “strength of materials” problems. Since in American engineering mechanics problems the areas involved are of a size most conveniently measured, and shown on drawings, in inches, and stresses are expressed in Pounds per square inch, the moment of inertia of an area is most commonly and usefully expressed in inches$^4$. We will use in$^4$ as the proper form for answers in these units in ACU.

In SI, the situation is a bit more complex. Although areas often given on drawings in centimeters, in calculations meters are the correct unit. We will use m$^4$ as the proper form for answers in these units in SI.

**Moment of Inertia of Composite Areas**

Moment of inertia for a composite area may be found by direct addition or subtraction of the moments of inertia of the parts as long as the moments of inertia of the parts are all known about the desired axis.

**Problem 29-1**

Use subtraction to find $I_x$ and $I_y$ for the scalene triangle shown.

\[
\begin{array}{c}
\text{Part} \quad I_{xp} \quad I_{yp} \\
\text{A} \quad \text{B} \\
\text{A - B} \\
\end{array}
\]
**Parallel Axis Theorem**

The parallel axis theorem enables us to find the moment of inertia of an area about any axis in terms of a parallel axis passing through the centroid of the area. It is most conveniently expressed in terms of the transfer equation

\[ I_{xa} = \] 

In this equation \( I_{xa} \) is ________________________, 

\( I_{xG} \) is __________________, and \( d \) is ________________________.

**Problem 29-2**

The circle is 4 centimeters in diameter. Find \( I_y \).

The transfer equation may also be used in reverse to find \( I_{xG} \) if the moment of inertia is known about any \( x \)-axis.

**Problem 29-3**

Find \( I_{xG} \) for the semi-circle by use of the transfer equation.

Complete the table on page 28-4 and return to Frame 29-24.
Choice of Reference Axis

There is no right or wrong reference axis. There are, however, axes that result in easier work than others.

Easy work usually results from an axis chosen according to one or more of the following criteria:

(1.) ______________________________________________________________________ (29-34)
(2.) ______________________________________________________________________ (29-36)
(3.) ______________________________________________________________________ (29-36)
(4.) ______________________________________________________________________ (29-37)
(5.) ______________________________________________________________________ (29-38)

Problem 29-4

Find the moment of inertia about a horizontal axis through the centroid ($I_xG$) for the area shown. I'll leave it to you to practice drawing the table this time.

![Diagram of an area moment of inertia problem]
Unit 30
Moments of Inertia of Mass

The moment of inertia of a mass, of density \( \delta \), is given by the integral

\[ I = \frac{\int \rho r^2 \, dV}{M} \]  

(30-3)

In selecting the element it is necessary to exercise care that the entire element be a constant distance from the axis in question. This generally results in a multiple integration, for which the best reference is a calculus book.

As you work through this unit you will record the results of evaluating the integrals for several common engineering shapes on the following page.
Moment of Inertia of Geometric Shapes

Cylinder about its geometric axis.

\[ I_z = \]

Thin disk about a diametric-axis through the mass center.

\[ I_y = \]

Cylinder about a diametric-axis through the mass center.

\[ I_x = \]

Rectangular parallelepiped about an axis parallel to a longitudinal face and passing through the mass center.

\[ I_x = \]

Slender rod of any cross-section about an axis perpendicular to the longitudinal axis and passing through the mass center.

\[ I_x = \]

Sphere about any axis through its mass center.

\[ I_z = \frac{2}{5} M r^2 \]
Problem 30-1

The mallet shown has a head weighing 8 lb and a handle weighing 2 lb.

1. Determine $I_{AA}$ for this body in slug-ft$^2$.

2. Determine the moment of inertia of the mallet about an axis parallel to the A-A axis but passing through its mass center.
Radius of Gyration

The radius of gyration of a mass about a given axis is defined as _____________________
_________________________________________________________________________________
It is calculated from the equation $k = \frac{I}{M}$ (30-41)

Problem 30-2

Find the radius of gyration of the body in Problem 30-1 about an axis through the mass center parallel to $A-A$.

$k_G = \underline{\hphantom{00000}}$

Find the radius of gyration of the body about $A-A$.

$k_{A-A} = \underline{\hphantom{00000}}$
Problem 30-3

The roly-poly shown has a mass of 1 kilogram and a radius of gyration of 8 centimeters about its mass center. What is its moment of inertia about an axis through its mass center?
